14. ABSTRACT

Blade displacement measurements using multi-camera photogrammetry techniques were acquired for a full-scale UH-60A rotor, tested in the National Full-Scale Aerodynamics Complex (NFAC) 40- by 80-Foot Wind Tunnel. The measurements, acquired over the full rotor azimuth, encompassed a range of test conditions that included advance ratios from 0.15 to 1.0, thrust coefficient to rotor solidity ratios from 0.01 to 0.13, and rotor shaft angles from -10.0 to 8.0 degrees. The objective was to measure the blade displacements and deformations of the four rotor blades and provide a benchmark blade displacement database to be used in the development and validation of rotorcraft prediction techniques. The blade displacement measurement methodology, system development, and data analysis techniques are presented. Sample results are shown based on the final set of camera calibrations, data reduction procedures, and estimated corrections that account for registration errors due to blade elasticity.
