Appendix D- Rotor Smoothing Static Data

Initial rotor tracking was accomplished by adjusting pitch links. No trim tab adjustments were used for tracking. The blades were tracked within ± 0.25 in. during hover and checked during forward flight runs. Rotor smoothing using an active trailing-edge flap is achieved by making steady-state inputs to individual flaps. Blades #1 or #2 were selected for the steady state inputs. Using the position control, the flaps were stepped up by 1-deg increments from -3 deg to 3 deg. The effectiveness of this technique was measured using the mean thrust and 1/rev roll and pitch moments resulting from the rotational lift. All test conditions for rotor smoothing are listed immediately below. Not all of the data associated with these conditions have been subjected to the control criteria discussed in the Data Analysis section. Appendices D and E contain rotor smoothing data that *were* subjected to the control criteria.

Appendix E- Rotor Smoothing Dynamic Data

Initial rotor tracking was accomplished by adjusting pitch links. No trim tab adjustments were used for tracking. The blades were tracked within ± 0.25 in. during hover and checked during forward flight runs. Rotor smoothing using an active trailing-edge flap is achieved by making steady-state inputs to individual flaps. Blades #1 or #2 were selected for the steady state inputs. Using the position control, the flaps were stepped up by 1-deg increments from -3 deg to 3 deg. The effectiveness of this technique was measured using the mean thrust and 1/rev roll and pitch moments resulting from the rotational lift. All test conditions for rotor smoothing are listed immediately below. Not all of the data associated with these conditions have been subjected to the control criteria discussed in the Data Analysis section. Appendices D and E contain rotor smoothing data that *were* subjected to the control criteria.

LONGA	Rotor longitudinal control input, obtained from the actuator A set of LVDTs, positive nose down at PSI = 90 deg, deg	deg	nose down at PSI = 90 deg
OMR	Rotor tip speed	ft/s	CCW from top
MAT	Rotor advancing tip Mach number		
RPM	Rotor rpm	rpm	ccw from top
ROLLRH	Rotor roll moment in-lb, obtained from the rotor balance, corrected for weight tare and shaft rotation tare	in-lbf	right down
Flap 1 Phase	Phase angle flap 1 began	deg	CCW zero over tail
PS	Static pressure at tunnel centerline	psfa	
PITCHRH	Rotor pitch moment in-lb, obtained from the rotor balance, corrected for weight tare and shaft rotation tare	in-lbf	nose up
Flap 1 Harm	Harmonic/s induced into flap controller		
RHO	Air density	slug/ft^3	
TORQ	Rotor torque, in-lb	in-lbf	drag
Q	Corrected tunnel dynamic pressure	psf	
TSR	Tunnel static temperature	deg_R	
SIDERH	Rotor side force, lb, obtained from the rotor balance, corrected for weight tare and shaft rotation tare	lbf	right
CSND	Tunnel speed of sound	ft/s	
VISC	Tunnel air viscosity	slug/ft-sec	
DRAGRH	Rotor drag force, lb, obtained from the rotor balance, corrected for weight tare and shaft rotation tare	lbf	aft
CPOS	Rotor power coefficient over sigma

Appendix F- Performance Static Data

SMART rotor performance data was obtained for several values of advance ratio, rotor shaft angle, and thrust. Rotor performance, defined here as rotor L/D, was studied by varying the 2P flap input from 0–1.5 deg at $\mu = 0.3$. The rotor performance data were obtained with the rotor trimmed for minimum 1P flapping. Two methods of achieving this were investigated: (1) setting flap actuator voltage to zero, and (2) commanding the flap deflection to zero. Both open loop and closed loop feedback control, using a continuous time higher harmonic controller (CTHHC) (ref. 11) were used to drive flap actuation. All test conditions for the performance study are listed immediately below. Not all of the data associated with these conditions have been subjected to the control criteria discussed in the Data Analysis section. Appendices F and G contain performance data that *were* subjected to the control criteria.

Appendix G- Performance Dynamic Data

SMART rotor performance data was obtained for several values of advance ratio, rotor shaft angle, and thrust. Rotor performance, defined here as rotor L/D, was studied by varying the 2P flap input from 0–1.5 deg at $\mu = 0.3$. The rotor performance data were obtained with the rotor trimmed for minimum 1P flapping. Two methods of achieving this were investigated: (1) setting flap actuator voltage to zero, and (2) commanding the flap deflection to zero. Both open loop and closed loop feedback control, using a continuous time higher harmonic controller (CTHHC) (ref. 11) were used to drive flap actuation. All test conditions for the performance study are listed immediately below. Not all of the data associated with these conditions have been subjected to the control criteria discussed in the Data Analysis section. Appendices F and G contain performance data that *were* subjected to the control criteria.

STATIC DATA PARAMETERS AND DESCRIPTIONS

Channel Name	Description	Units	Positive Direction
VKTS	Tunnel speed	kt	
ALFSC	Corrected angle-of-attack, Boeing Data	deg	aft
HP	Horsepower from rotor torque	HP	
THRUST	Rotor thrust, lb, force parallel to the rotor shaft	lbf	up
COLLA	Rotor collective control input, obtained from the actuator A set of LVDTs, positive nose up, deg	deg	nose up
MTUN	Tunnel Mach number		
CTOS	Rotor thrust coefficient over sigma, parallel to the rotor shaft		up
LATA	Rotor lateral control input, obtained from the actuator A set of LVDTs, positive nose down at PSI = 0 deg, deg	deg	nose down at PSI = 0 deg
MU	Rotor tip speed ratio		
MTIP	Tip Mach number		
Flap 1 Amp	Flap 1 maximum angle	deg	t.e. down
LONGA	Rotor longitudinal control input, obtained from the actuator A set of LVDTs, positive nose down at PSI = 90 deg, deg	deg	nose down at PSI = 90 deg
OMR	Rotor tip speed	ft/s	CCW from top
MAT	Rotor advancing tip Mach number		
RPM	Rotor rpm	rpm	ccw from top
ROLLRH	Rotor roll moment in-lb, obtained from the rotor balance, corrected for weight tare and shaft rotation tare	in-lbf	right down
Flap 1 Phase	Phase angle flap 1 began	deg	CCW zero over tail
PS	Static pressure at tunnel centerline	psfa	
PITCHRH	Rotor pitch moment in-lb, obtained from the rotor balance, corrected for weight tare and shaft rotation tare	in-lbf	nose up
Flap 1 Harm	Harmonic/s induced into flap controller		
RHO	Air density	slug/ft^3	
TORQ	Rotor torque, in-lb	in-lbf	drag
Q	Corrected tunnel dynamic pressure	psf	
TSR	Tunnel static temperature	deg_R	
SIDERH	Rotor side force, lb, obtained from the rotor balance, corrected for weight tare and shaft rotation tare	lbf	right
CSND	Tunnel speed of sound	ft/s	
VISC	Tunnel air viscosity	slug/ft-sec	
DRAGRH	Rotor drag force, lb, obtained from the rotor balance, corrected for weight tare and shaft rotation tare	lbf	aft
CPOS	Rotor power coefficient over sigma

Appendix H- Vibration Reduction Static Data

Vibration reduction with closed loop feedback of vibratory hub loads was demonstrated using a CTHHC (ref. 11). Numerous active flap frequency sweeps were conducted to obtain data required for the flight controls objective and for determining the parameters for the closed loop CTHHC vibration controllers. Open loop flap 4P, 5P, and 6P inputs with phase sweeps were used to establish the effectiveness of the flap in reducing vibratory hub loads. The flaps were driven using open loop voltage commands without position feedback control. The effectiveness of the active flap to modify the aerodynamic loading and reduce vibratory hub loads was evaluated at two flight conditions, descent ($\mu = 0.2$, $\alpha = 2$ deg) and level flight ($\mu = 0.3$, $\alpha = -9.1$ deg). All test conditions for vibration reduction are listed immediately below. Not all of the data associated with these conditions have been subjected to the control criteria discussed in the Data Analysis section. Appendices H and I contain vibration reduction data that *were* subjected to the control criteria.

Appendix I- Vibration Reduction Dynamic Data

Vibration reduction with closed loop feedback of vibratory hub loads was demonstrated using a CTHHC (ref. 11). Numerous active flap frequency sweeps were conducted to obtain data required for the flight controls objective and for determining the parameters for the closed loop CTHHC vibration controllers. Open loop flap 4P, 5P, and 6P inputs with phase sweeps were used to establish the effectiveness of the flap in reducing vibratory hub loads. The flaps were driven using open loop voltage commands without position feedback control. The effectiveness of the active flap to modify the aerodynamic loading and reduce vibratory hub loads was evaluated at two flight conditions, descent ($\mu = 0.2$, $\alpha = 2$ deg) and level flight ($\mu = 0.3$, $\alpha = -9.1$ deg). All test conditions for vibration reduction are listed immediately below. Not all of the data associated with these conditions have been subjected to the control criteria discussed in the Data Analysis section. Appendices H and I contain vibration reduction data that *were* subjected to the control criteria.

Appendix J- Control Power Static Data

Control power from the active flaps was evaluated by applying equivalent steady-state collective, lateral, or longitudinal cyclic flap deflections and observing the resulting changes in normal force, roll, and pitch moment. Flaps were controlled either by individual blade control (IBC), specifying harmonic and phase, or through software implementation of a virtual swashplate (VSP), using amplitude and collective, longitudinal, and lateral cyclic commands. Flap deflections were generated from -3 to 3 deg using the VSP software for flap inputs on each blade, or by applying steady offset for collective $1P/90$ deg for roll and $1P/180$ deg for pitch inputs (IBC). Results for position control flap inputs, both VSP and IBC, and comparable swashplate inputs were obtained at $\mu = 0.2$ for level flight and descent, and for level flight at $\mu = 0.3$. All test conditions for the control power study are listed immediately below. Not all of the data associated with these conditions have been subjected to the control criteria discussed in the Data Analysis section. Appendices J and K contain control power data that *were* subjected to the control criteria.

Appendix K- Control Power Dynamic Data

Control power from the active flaps was evaluated by applying equivalent steady-state collective, lateral, or longitudinal cyclic flap deflections and observing the resulting changes in normal force, roll, and pitch moment. Flaps were controlled either by individual blade control (IBC), specifying harmonic and phase, or through software implementation of a virtual swashplate (VSP), using amplitude and collective, longitudinal, and lateral cyclic commands. Flap deflections were generated from -3 to 3 deg using the VSP software for flap inputs on each blade, or by applying steady offset for collective $1P/90$ deg for roll and $1P/180$ deg for pitch inputs (IBC). Results for position control flap inputs, both VSP and IBC, and comparable swashplate inputs were obtained at $\mu = 0.2$ for level flight and descent, and for level flight at $\mu = 0.3$. All test conditions for the control power study are listed immediately below. Not all of the data associated with these conditions have been subjected to the control criteria discussed in the Data Analysis section. Appendices J and K contain control power data that *were* subjected to the control criteria.
